

SILT FENCING is one of the most effective temporary sediment control devices available.

Protecting the environment, via the installation of silt fence, is becoming a standard requirement of most construction projects.

S&K PACKAGING

SILT FENCE

An S & K silt fence will withstand concentrated flows, heavy winds, and retain up to 18 inches of sediment. Our Silt Fences are inexpensive, recyclable, and easy to install.

A Silt Fence is a temporary sediment control device that is used around the perimeter of construction areas to help protect streams, rivers, and lakes from contamination by silt, sediment and construction debris. Our Silt Fence consists of a geomembrane which is stretched between a series of wooden stakes. The fabric we use is manufactured using UV stabilized, high tenacity polypropylene yarns that are woven to form a dimensionally stable network. This fabric is highly durable and provides excellent water flow and silt retention.

Silt Fence Applications

- ◆ Along the perimeter of a project
- ◆ Below the toe or down slope of exposed and erodible slopes
- ◆ Along streams and channels
- ◆ Around temporary spoil areas and stockpiles
- ◆ Below other small cleared areas

Labor and Cost Savings

Eliminates trenching | Eliminates backfilling and compaction problems | Eliminates the high maintenance of trenching equipment (dig chain & parts) | Eliminates fence material overlap (waste) | Minimizes traction problems in hard or soft ground | Eliminates the use of heavy equipment | Minimize wash-out/blow-out at the bottom of fence | Minimize spoil on both sides of the fence
